Shawn, the excavations were filled with native soils if deeper the 6 inches. The cap is generally 6 inches over everything. Some areas only have the 6 inch cap. Jean

Thanks very much for prompt reply. I thought the cap was 6 inches. But did we not excavate out soil exceeding goals and fill the void with new soil ?? So the total will be say 2 feet replaced + 6 inches . So the residual contaminated soils are below 2.5 feet ????? . Also I will shorten the language to what I had sent you. I guessed the right place .

Thanks again
Shawn Ghose
